

Press Release

Leica SL2 - Firmware Update 2.0

Multishot-Mode and further improvements.

Wetzlar, June 19, 2020. Leica Camera AG has released the latest firmware update for the Leica SL2. In addition to minor improvements in the graphical interface of the video menu, a more convenient control of the AF field size and a new naming routine of SD cards after the in-camera formatting, the Multishot mode that is now available stands out. With the help of the Sensor Shift Technology used in the SL2, the camera produces a 47 megapixel image in Multishot mode, as well as a second image with around 187 megapixels. To create this, the camera takes up to eight sequential images, with the sensor being shifted in half-pixel increments between each shot. The result is an extreme increase in the detail resolution of the generated DNG data, which is particularly effective when taking pictures from a tripod. The Firmware Update Version 2.0 for the Leica SL2 will be available for download on the Leica Camera AG website from June 19, 2020.
